PHYWE

General information

Application PHYWE

Storage of electrical energy from

Wind energy with one battery

With renewable energy sources, improving storage options is very important. When the wind blows continuously, wind turbines store the energy in a battery.

Real wind turbines usually use a lead-acid battery, which has a similar efficiency to the Ni-MH battery used.

This experiment is intended to illustrate how electrical energy from a wind turbine can be stored so that it can be used at another time.

Other information (1/2)

PHYWE

Previous

The basics of measuring current and voltage as well as the determination of energy and power from these measurands should be known.

Principle

In an accumulator, electrical energy is converted into chemical energy and stored. The stored energy can then be converted back into the desired form.

This experiment also shows that losses cannot be avoided during conversion and storage.

Other information (2/2)

PHYWE

Learning

Students recognize the relationship between energy released from a wind turbine for storage and later use.

Note

The blower may be operated with a maximum voltage of 12 V, otherwise the motor could be destroyed.

Pre-shift when handling the generator. Avoid reaching into the rotating rotor blades.

To improve the test results, it is necessary to condition the battery by charging and discharging it several times before the actual test. In the execution, a battery should be charged first, so that an empty battery should be taken.

Safety instructions

PHYWE

The general instructions for safe experimentation in science lessons apply to this experiment.

For H- and P-phrases please refer to the safety data sheet of the respective chemical.

Theory

- The accumulator is a rechargeable element.
- During charging, electrical energy is converted into chemical energy in an accumulator.
- If a consumer is connected, the chemical energy is converted back into electrical energy.
- Each accumulator has a nominal voltage as a reference value or marking.

Experimental setup - Discharging the battery with a

Equipment

PHYWE

Structure and implementation

Set-up (1/3)

PHYWE

- Attach the blower with the bracket to the left side of the panel (see illustration).
- Align the blower so that it creates a horizontal wind stream along the panel.
- Set up a tripod bench for the windmill. Slide the glider onto the two stand rods and guide the rods through the two holes in the clamps.

Set-up (2/3)

- Place the stand bench against the board and align it horizontally.
- Attach the 6 rotor blades to the wind generator. For a good result, point the matte side of the rotor blades away from the wind.
- Place the wind generator in the hole of the glider.

Set-up (3/3)

- Set up the circuit according to the illustration, paying attention to the following:
- The polarity of the battery.
- The changeover switch closes the circuit with the incandescent lamp.
- The multimeters should be able to measure the voltage and current in both circuits.
- Connect the blower to the DC output of the power supply.

Procedure (1/3)

PHYWE

- $\,\circ\,$ Set the voltage at the power supply unit to 12 V.
- Flip the switch and charge the battery.
- After 30 seconds, observe the readings and stop loading.
- Set the voltage at the power supply unit to 0 V.

Procedure (2/3)

PHYWE

- Adjust the measuring points in the circuit accordingly.
- Flip the switch and discharge the battery. The fan remains off.
- Observe the bulb and the readings.
- Note the time when the light bulb stops

Procedure (3/3)

- Repeat the test with a battery charging time of 60 seconds and then also with 120 and 240 seconds.
- Transfer measured values to the table in the evaluation.

Evaluation (1/2)

PHYWE

30s 60s 120s 240s

Loading time

Lighting duration

Fill in the missing words.

If the charging time is longer, the bulb will shine longer. However, the duration of the light bulb never reaches the length of the .

|---|---|--------|
| | | C.neck |
| | _ | CHOOK |
| \ | | |

Evaluation (2/2) PHYWE Drag the correct words into the gaps! It can be clearly seen that the electrical work involved in the battery is light significantly less than that involved in the battery. This is partly due to the power of the nickel-metal hydride accumulator, which is about 70%, and partly charging due to the fact that the incandescent lamp emits most of its energy in the form of efficiency and a smaller part in the form of . Further, it can be seen discharging that the incandescent lamp requires as much to light as the wind turbine heat supplied. Check
